FRANCHISE ECOES

High profits of 250% – 400% for entrepreneurs with a vision for business development. Own a High-Yield Mobile Energy Franchise Business Across Europe, Africa, Asia, and Latin America

Welcome to the future of transport infrastructure. **ECOES (ECO Engineering Systems)** introduces a disruptive, turnkey Franchise Network designed for high-growth transit corridors across Europe, Africa, Asia, and Latin America. We provide entrepreneurs and corporate partners with a proven, fully automated **"Business in a Box"** Welcome to the future of transport infrastructure. **ECOES (ECO Engineering Systems)** introduces a disruptive, turnkey Franchise Network designed for high-growth transit corridors across Europe, Africa, Asia, and Latin America. We provide entrepreneurs and corporate partners with a proven, fully automated **"Business in a Box" —** giving you the exclusive rights to operate a premier mobile energy and retail network under the international ECOES brand.

By becoming an ECOES Franchise, you bypass real estate bottlenecks, years of heavy grid construction delays, and static location risks, launching a multi-megawatt enterprise in record time.

The Franchise Economic Engine: 250% - 400% Guaranteed Margins
Traditional static charging stations are financially trapped by skyrocketing commercial land prices and long administrative delays for high-voltage grid upgrades. The ECOES Franchise Model unlocks massive profitability through strategic energy arbitrage and commercial synergy:
• **Ultra-Low-Cost Charging (The Night Tariff):** Your ECOES mobile units are parked at your standard industrial warehouse overnight, charging directly from the grid using cheap

night-rate electricity or automated smart-charging contracts during low-demand hours.
• **Premium Energy Reselling (The Peak Highway Margin):** During peak daytime transit hours, your mobile hubs are deployed directly to critical highway chokepoints or temporary logistics dead zones where infrastructure is lacking. You sell high-power DC electricity to to-e-cars and commercial e-trucks and heavy transport fleets at premium highway rates, locking in a massive 2.5x to 3x return per kWh.
• **Synergy Retail Revenue (Dwell Time Economy):** Maximize cash flow during the driver's wait time. Factory-integrated, automated vending niches for premium coffee, water, packaged foods, etc., turn your mobile hub into a high-margin, on-the-go retail point, capturing secondary revenue from both EV drivers and passing conventional vehicles.

The 24-Hour Continuous "Shuttle" Model (Zero Asset Downtime)
The ECOES Franchise operations rely on a continuous, high-efficiency **"Drop and Hook"** rotation utilizing two independent trailer units per operational hub, eliminating the need for heavy machinery, cranes, or forklifts on site:
*** The Cash Generator (On the Road):** While Trailer A (over 1000 kWh) is stationed at your designated high-traffic transit point, rapidly fast-charging cars and trucks and generating instant revenue, Trailer B is plugged in back at your industrial base.
* **The Energy Sponge (At the Base):** Trailer B absorbs cheap grid power or zero-cost solar energy at a steady, optimized rate without human supervision.
* **The 5-10 Minute Swap:** As soon as Trailer A runs empty, the tractor truck brings it back to the base, drops it for recharging, hooks up the fully charged Trailer B, and heads back to the highway. **Your business never sleeps, and you avoid all vehicle idle time.**
*** The tow truck that swaps the mobile battery modules is also electric**. It is a new ECOES electric truck featuring a low price and low operating costs. With a daily range of 500–600 km for replacing the battery modules, the electric tractor ECOES unit will generate savings of **80,000–100,000EUR per year** in diesel and operating costs, **directly increasing the franchisee's profit.**

Unmatched Financial Performance: about 70 Vehicles Charged per Day
By rotating two over 1000 kWh trailers within a 24-hour cycle, your mobile franchise hub delivers over 1600 kWh of net, usable high-power DC energy daily (accounting for cooling and transfer efficiency).
• At an average consumption of **30 kWh - 40 kWh per vehicle**, an ECOES franchise location grid-services about **70 vehicles** every single day.
• Combined with a **250%–400%** price margin and steady secondary vending revenues, the entire system achieves full capital payback in less than **12 months,** transitioning into a pure cash-generating enterprise. **Flexible Configuration Tailored to Your Region:**

The Smart Grid Arbitrage Package (ECOES Night Charger):
Best for high-density transit corridors and urban limits. Capitalizes on low-cost night tariffs or peak industrial power grid connections. Charge your mobile hub cheaply at your warehouse overnight, and sell premium fast-charging DC power on the highway during peak hours. No solar permits required, ready to deploy instantly.
• **The Autonomous Island Package (ECOES Solar Grid):**
Best for sun-rich regions and off-grid locations (Southern Europe, Asia, Africa, and Latin America). Charges directly from a localized solar farm at your base for zero-cost primary energy and absolute independence from the electrical grid.

100% Protection Against Location & Administrative Risks
In all countries, infrastructure risks are exceptionally high. Traditional static charging stations face catastrophic losses if a major highway undergoes months of road repair or if a new bypass redirects commercial traffic.
With the ECOES Franchise, your location risk is exactly ZERO:

If a traffic route changes, if construction disrupts your spot, or if a new high-demand transit corridor opens up, you simply hook your mobile hub to your truck and relocate your entire multi-megawatt business to the **high-traffic area within 1 hour. Your asset maintains 100% liquidity, flexibility, and utility.**

Centralized Sofia Tech Support & Automated Sat-Cloud Billing
As a franchisee, you are backed by our advanced centralized software core integrated by electronic experts in **the EU (Sofia, Bulgaria),** utilizing premium, highly liquid hardware **(Dyness industrial LFP battery racks in stock):**
• **Automated White-Label Billing**: Integrated with Europe's leading OCPP roaming networks and POS terminals. Commercial truck drivers pay seamlessly via standard fleet cards (DKV, UTA), international credit cards, or digital wallets. All revenues are digitally tracked and routed directly to the franchisee's secure bank account.
• **Starlink Global Satellite Fleet Management:** Every unit is connected via a dedicated Starlink terminal, allowing you to track live transactions, battery temperatures, state of charge (SoC), and GPS location from a central smartphone dashboard.
• **Anti-Theft Encrypted Lock:** The entire energy flow is managed by cryptographically secured firmware. Any unauthorized movement or physical breach instantly flags our central system and locks the battery output via satellite signal, making the asset **100% secure.**

Bankable Turnkey Franchise: Fast-Track Credit Approval
Because the ECOES Franchise relies on elite, certified global components (*Dyness / Deye / Huawei* grade), features strict digital financial transparency, and carries an international brand guarantee, European and other banking institutions classify this system as a **Low-Risk Sustainable Asset**.
This unlocks immediate access to preferential green credit lines and commercial leasing packages for our franchise partners, ensuring a seamless setup and an accelerated **ROI within 12 to 14 months**.

IMPORTANT FOR SOLAR SYSTEM OWNERS

Individuals and companies that have already built solar parks are **forced** to sell the electricity they generate to the state or to private energy operators at very low prices. This is due to state regulations governing electricity sales and the use of state infrastructure—such as transmission lines, transformers, and other facilities. Across various countries, average purchase prices for solar energy range from **approximately $/€0.04/kW - $/€0.09/KW** furthermore, during peak hours, solar energy is often purchased at even **lower rates or not purchased at all.**

By using the ECOES Franchise, you become independent of state regulations regarding the sale of electricity to the government and its energy infrastructure, as you do not sell electricity to the state or energy operators. Instead, you sell your electricity directly to private individuals.

The prices at which you sell your electricity for vehicle charging will be approximately **4–6 times (400%–600%)** higher than the rates at which the state or energy operators currently purchase your electricity. This means that your profit will increase **5 times (500%)** on average.

Join the ECOES Franchise Network Today
Secure the exclusive rights for your region or primary transport route. Contact our central integration office in Sofia to receive your complete **Franchise Investment, which will help you secure bank financing.**
